

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Riparian Buffers in Oregon CZARA

General CZARA Guidelines for Approval: Two ways for states to have an approvable program: 1) *regulatory program*; **OR** 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.¹

Medium and Small-Fish Bearing Streams: Regulatory Program

Deficiencies: Small no-cut buffer for small and medium fish-bearing streams. Creates temperature, sediment, and runoff problems.

1. Regulatory Program Needs:

- a. Riparian rule should be completed by end of 2015.
- b. Scope of waters should include all waters with salmon, steelhead, and bulltrout, and colder waters a certain distance upstream of where salmonids and fish are present.
- c. No cut buffers should be at least 50 feet. There may be a wider buffer area with harvest restrictions. Note that ODF is in the process of analyzing RipStream results to determine appropriate buffer sizes for small and medium fish-bearing streams.

What Oregon Proposed:

- Regulatory: Riparian buffer/management requirements for fish-bearing streams (~20 ft no cut and harvest restrictions to ~50-70 ft from stream).
- Potential Rule Change: Board of Forestry is considering increasing riparian protection requirements for fish-bearing streams.

Why Oregon's Efforts Are Not Sufficient:

- Scientific, state and ODF studies clearly indicate that riparian protection around small and medium fish bearing streams and non-fish bearing streams in Oregon is not sufficient to protect water quality and beneficial uses.

¹ [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing "BMP shields" and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

- The 2011 ODF RipStream study found that FPA riparian protections on private forest lands did not ensure achievement of the Protection of Cold Water criterion (PCW) under the Oregon water quality standard for temperature.
- Even the Board of Forestry has acknowledged current rules are not adequate to protect small and medium fish-bearing streams.
- Achieving proposed rule change would be an important accomplishment for Oregon but the rule must be adopted, the riparian buffer protective, and it must apply to all small and medium fish-bearing streams.
- Oregon's buffer protections are also much less stringent than requirements for neighboring states and federal lands.
- Forestry industry and some commenters cited results from a Watersheds Research Cooperative ("paired watershed study") as evidence that current FPA riparian buffers are effective at achieving water quality standards and protect designated uses.
 - Net overall temperature decrease after clear-cut harvesting along non-fish bearing streams were likely because of increased slash debris along the stream after harvest, not allowed by FPA.
 - Without slash, temperature results are consistent with RipStream findings.

Small, Non-fish bearing streams: voluntary approach

Deficiencies: No buffers for non-fish bearing streams. (Note: Non-fish bearing streams make up at least 70% of the stream miles in Oregon coastal areas.) Creates temperature, sediment, and runoff problems for salmon spawning areas and downstream habitat.

1. Voluntary Approach Needs:

- a. **Program Description:** Describe the voluntary or incentive-based program the state will use to encourage implementation of the additional management measure to provide greater protection of riparian buffers along non-fish bearing streams. . Examples include: Voluntary buffers and protections from 50-100 feet. 50-foot no-cut buffers. Scope should include non-fish bearing streams especially those affecting downstream water quality above confluences of nonfish bearing streams and fish-bearing streams, buffering hollows, inner gorges, headwalls, unstable landforms, and stream initiation points, and special aquatic sites like seeps, springs, wetlands and beaver ponds.
- b. **Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. Could use monitoring and tracking methods similar to other ODF programs.
- c. **Enforceable Mechanism:** Demonstrate the state has enforcement authorities that can be used to prevent nonpoint pollution and require implementation of this measure, as necessary. Include a description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

What Oregon Proposed:

- No regulatory buffer requirements for non-fish streams
- Voluntary: Voluntary measures such a large wood placement, retaining additional basal area, and treating non-fish bearing streams as fish-bearing streams.

Why Oregon's Efforts Are Not Sufficient:

- Scientific, state and ODF studies clearly indicate that riparian protection around non-fish bearing streams in Oregon is not sufficient to protect water quality and beneficial uses.
 - The 2011 ODF RipStream study found that FPA riparian protections on private forest lands did not ensure achievement of the Protection of Cold Water criterion (PCW) under the Oregon water quality standard for temperature.
- Oregon's buffer protections are also much less stringent than requirements for neighboring states and federal lands.
- Forestry industry and some commenters cited results from a Watersheds Research Cooperative ("paired watershed study") as evidence that current FPA riparian buffers are effective at achieving water quality standards and protect designated uses.
 - Net overall temperature decrease after clear-cut harvesting along non-fish bearing streams were likely because of increased slash debris along the stream after harvest, not allowed by FPA.
 - Without slash, temperature results are consistent with RipStream findings.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Roads in Oregon CZARA

- **General CZARA Guidelines for Approval:** Two ways for states to have an approvable program: 1) *regulatory program*; **OR** 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.²

Roads: Voluntary Approach

Deficiencies: Does not include legacy roads. Oregon's voluntary approach does not include monitoring and tracking.

1. Voluntary Approach Needs:

- Program Description:** Describe the voluntary or incentive-based program the state will use to encourage implementation of the additional management measures for forestry roads. Examples include:
 - i. Move forward with establishing road survey or inventory program that considers both active, inactive, and legacy roads.
 - ii. The program should establish a timeline for addressing priority road issues, including retiring or restoring forest roads that impair water quality.
- Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. Examples include:
 - i. Develop a requirement to track and report on progress to remediate identified forest road problems. Implementation principles could include addressing the worst road problems or highest risk categories earlier in the overall timeline.
 - ii. Establish milestone-based targets, such as the maximum percentage of a road network allowed to discharge directly to streams and other waterbodies
 - iii. Identify effective BMPs maintaining and correcting water quality problems caused by legacy forestry roads.
 - iv.

² [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing "BMP shields" and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

v.

- c. **Enforceable Mechanism:** Explore existing state enforcement authorities that can be used to prevent nonpoint pollution and require implementation of this measure, as necessary. Include a description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

What Oregon Proposed

- Regulatory: Board of Forestry has made several improvements to general road maintenance measures to improve water quality:
 - Establishment of a “Critical Locations” policy to avoid building roads in critical locations such as high hazards landslide areas, steep slopes, or within 50 feet of waterbodies;
 - Creation of additional rules to address wet-weather hauling; and
 - Revision of an existing road drainage rule to reduce sediment delivery.
- Voluntary: several different restoration and monitoring activities including:
 - OWEB voluntary Road Hazard and Identification and Risk Reduction Project where forestland owners survey road networks to identify roads that pose risks to salmonid habitat and prioritize roads for remediation. Oregon reports that thousands of road miles have been inspected and repaired across Oregon since the inception of this program in 1997.
 - Cooperative agreement with the USDA Forest Service to update the State’s GIS data layer for forest roads. The data layer will help Oregon conduct a rapid road survey to evaluate and prioritize road risks to soil and water resources.
 - Undertaking a third-party audit in 2014 to assess compliance with the FPA rules governing forest road construction and maintenance.

Why Oregon’s Efforts Are Not Sufficient

- 2005 Oregon Coastal Coho Assessment by OWEB/ODFW shows that old roads make up majority of forest roads, and road inventory on private land is not widely available.
- New Regulatory Drainage Requirements: The rule changes and new policies do not sufficiently address water quality problems associated with “legacy roads” (e.g., roads that do not meet current state requirements with respect to siting, construction, maintenance, and road drainage). Requirements are triggered only when new road construction or re-construction of existing roads occurs.
- Voluntary Road Hazard/Identification Program: Oregon did not indicate the program’s impact within the coastal nonpoint program management area or how many of these projects addressed active forest roads and roads retired according to current FPA practices versus problems associated with older, legacy roads.
- Agreement with USDA to Update GIS Data Layers: In Oregon’s submittal. Oregon noted it hoped to begin survey in 2014; therefore this survey cannot count towards coastal NPS program until completed. Also, federal agencies are not aware if the survey and GIS layer will consider legacy roads or how Oregon will use the data to direct future management actions.
- Third-Party Audit: Issues resulting from legacy roads and general road maintenance issues where construction or reconstruction is not occurring would not be captured during compliance audit of FPA rules since these issues are outside the scope of rules.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Landslide-Prone Areas in Oregon CZARA

- **General CZARA Guidelines for Approval:** Two ways for states to have an approvable program: 1) *regulatory program*; **OR** 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.³

Landslide-Prone Areas: Voluntary Approach

Deficiencies: Does not protect for water resources.

1. **Voluntary Approach Needs:**

- a. **Program Description:** Describe voluntary, or incentive-based program(s) Oregon will use to encourage implementation of the additional management measures to protect high-risk landslide areas that have the potential to impact water quality and designated uses.. Examples include:
 - i. Develop scientifically rigorous process for identifying high-risk areas and unstable slopes based on field review by trained staff. Slope, landform, sediment and wood delivery potential and geologic factors should be used in the designation. LiDAR and DEMs are useful tools to identify and designate areas.
 - ii. Adopt harvest and road construction restrictions similar to those where landslides pose risks to life and property, for all high-risk landslide prone areas with moderate to high potential to impact water quality and designated uses.
 - iii. Develop and promote more robust voluntary practices to encourage and incentivize forestry best management practices to protect high-risk landslide areas that have the potential to impact water quality and designated uses, such as no-harvest restrictions around high-risk areas and building roads that minimize slope failures.

³ [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing “BMP shields” and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

- b. **Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. Examples include:
 - i. Institute a monitoring program to track compliance with the FPA rules and voluntary guidance for high-risk landslide prone areas and the effectiveness of these practices in reducing slope failures.
 - ii. Establish a monitoring program that assesses the underlying causes and water quality impacts of landslides shortly after they occur and generates specific recommendations for future management. In particular, look for ways to reduce channelized landslides.
- c. **Enforceable Mechanism:** Include a description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

What Oregon Proposed

- Regulatory: Amended FPA rules to require the identification of landslide hazard areas in timber harvesting plans and road construction and to place certain restrictions on harvest and road activities within these designated high-risk landslide areas for *public safety*.
- Voluntary: Promotes voluntary practices through Oregon Plan; gives landowners credit for leaving standing live trees along landslide-prone areas as a source of large wood.

Why Oregon's Efforts Are Not Sufficient:

- A number of studies continue to show significant increases in landslide rates after clear cutting compared to unmanaged forests in the Pacific Northwest. Research also shows that landslides degrade water quality and impair designated uses in Pacific Northwest streams.
- Regulatory Approach: Landslide hazards are addressed only as they relate to risks for losses of life and property, *not for potential water quality impacts*. Oregon still allows timber harvest and the construction of forest roads, where alternatives are not available, on high-risk landslide hazard areas as long as it is not deemed a public safety risk.
- Voluntary Approach: Practices are not designed to protect high-risk erosion areas but rather to ensure large wood is available to provide additional stream complexity when landslides occur.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Spray Buffers for Aerial Application of Herbicides on Non-fish Bearing Streams in Oregon CZARA

- **General CZARA Guidelines for Approval:** Two ways for states to have an approvable program: 1) *regulatory program*; **OR** 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.⁴

Spray Buffers for Aerial Application of Herbicides on Non-fish Bearing Streams: Voluntary Approach

Deficiencies: No spray buffer. Non-fish bearing streams make up at least 70% of Oregon coast stream network. Aerial drift and primary and secondary impacts to aquatic and terrestrial life.

1. **Adequate riparian protections for non-fish bearing streams may also be sufficient for herbicide spray buffers; OR**
2. **Voluntary Approach Needs:**
 - a. **Program Description:** Describe voluntary, or incentive-based program(s) Oregon will use to encourage implementation of the additional management measures to protect non-fish bearing streams during the aerial application of herbicides. Examples include:
 - i. Develop guidelines for voluntary buffer protections for aerial application of herbicides on non-fish bearing streams
 - ii. Educate and train aerial applicators of herbicides on the new guidance and how to minimize aerial drift to waterways, including non-fish bearing streams and surrounding communities;
 - iii. Provide better maps of non-fish bearing streams and other sensitive sites and structures to increase awareness of these sensitive areas that need protection among the aerial applicator community; and
 - iv. Employ GPS technology, linked to maps of non-fish bearing streams to automatically shut off nozzles before crossing non-fish bearing streams.

⁴ [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing “BMP shields” and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

- v. Revise ODF Notification of Operation form to add a check box for aerial applicators to adhere to FIFRA labels for all stream types.
- b. **Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. For example, track the implementation of voluntary measures for the aerial application of herbicides along non-fish bearing streams and assess the effectiveness of these practices to protect water quality and designated uses.
- c. **Enforceable Mechanism** – Explore existing state enforcement authorities that can be used to prevent nonpoint pollution and require implementation of this measure, as necessary. Include a description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

What Oregon Proposed:

- Regulatory:
 - Follows FIFRA label requirements.
 - ODF requires all pesticide applicators to complete a notification form of potential pesticides that may be applied.
 - ODF/ODA require pesticide applicators undergo training and obtain licenses. Training includes a review of regulations and requirements for protecting streams during aerial application. To reduce aerial drift, Oregon has guidance that instructs applicators to consider temperature, relative humidity, wind speed, and wind direction.
- Voluntary:
 - Water Quality Pesticide Management Plan (WQPMP): Interagency guide providing state-wide and watershed-level actions to protect surface and groundwater from potential impacts of pesticides, including herbicides. The plan, approved by EPA Region 10, describes management responses from voluntary to regulatory actions Oregon could take to address pesticide issues. The plan focuses on water quality monitoring data as the driver for adaptive management actions.
 - Pesticide Stewardship Partnership (PSP): Pilot pesticide water quality monitoring effort. ODEQ works with State and local partners to collect and analyze water samples and use the data to focus technical assistance and best management practices on streams and pesticides that pose a potential aquatic life or human health impact.

Why Oregon's Efforts Are Not Sufficient

- Oregon does not require riparian buffers during forest harvests along non-fish bearing streams, which might otherwise provide a spray buffer to filter herbicide-laden runoff before it enters the streams.
- NMFS BiOp for several EPA herbicide labels identifies aerial drift as the most likely pathway for herbicides to enter aquatic habitats affecting primary and secondary production. NMFS concluded that products containing 2,4-D are likely to jeopardize the existence of all listed salmonids and adversely modify or destroy critical habitat. Products containing diuron were also likely to adversely modify or destroy critical habitat.
- ODF's Notification Form: The form does not include guidance for spraying over non-fish bearing streams. Also allows for applicator to list many possible pesticides so it is difficult to determine which pesticide is actually applied.
- WQPMP and PSP: Water quality monitoring data on pesticides are still limited in Oregon. Oregon has only established eight pilot PSP monitoring areas in seven watersheds, none of which are within

the coastal nonpoint management area. Difficult to operate an adaptive management-driven program if you lack data to know when adjustments are needed.

- FIFRA: EPA, NMFS, USFWS and USDA are working to improve the national risk assessment process for pesticide labels but don't expect to update herbicide labels for ~ 15 yrs.
- Oregon and other Pacific Northwest states have already recognized the need to go beyond the national FIFRA label requirements. Neighboring states have stricter buffer requirements for herbicides application along non-fish bearing streams.

Implementation-Ready TMDLs and Oregon CZARA

Note that the State had originally agreed to complete an implementation-Ready TMDL for the Midcoast Basin as described in state memos to the original Settlement Agreement in order to meet CZARA requirements for 3 of 4 forestry measures. The original memo describing the state's commitments is available upon request.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Riparian Buffers in Oregon CZARA

General CZARA Guidelines for Approval: Two ways for states to have an approvable program: 1) *regulatory program*; OR 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.¹

Medium and Small-Fish Bearing Streams: Regulatory Program

Deficiencies: Small no-cut buffer for small and medium fish-bearing streams. Creates temperature, sediment, and runoff problems.

1. **Regulatory Program Needs:**

- a. Riparian rule should be completed by end of 2015.
- b. Scope of waters should include all waters with salmon, steelhead, and bulltrout, and colder waters a certain distance upstream of where salmonids and fish are present.
- c. No cut buffers should be at least 50 feet. There may be a wider buffer area with harvest restrictions. Note that ODF is in the process of analyzing RipStream results to determine appropriate buffer sizes for small and medium fish-bearing streams.

Comment [AC1]: This is still vague and open to interpretation. Should be as specific as possible. Are we looking at 10 ft or 1000ft?

What Oregon Proposed:

- **Regulatory:** Riparian buffer/management requirements for fish-bearing streams (~20 ft no cut and harvest restrictions to ~50-70 ft from stream).
- **Potential Rule Change:** Board of Forestry is considering increasing riparian protection requirements for fish-bearing streams.

Why Oregon's Efforts Are Not Sufficient:

- Scientific, state and ODF studies clearly indicate that riparian protection around small and medium fish bearing streams and non-fish bearing streams in Oregon is not sufficient to protect water quality and beneficial uses.

¹ [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing "BMP shields" and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

- The 2011 ODF RipStream study found that FPA riparian protections on private forest lands did not ensure achievement of the Protection of Cold Water criterion (PCW) under the Oregon water quality standard for temperature.
- Even the Board of Forestry has acknowledged current rules are not adequate to protect small and medium fish-bearing streams.
- Achieving proposed rule change would be an important accomplishment for Oregon but the rule must be adopted, the riparian buffer protective, and it must apply to all small and medium fish-bearing streams.
- Oregon’s buffer protections are also much less stringent than requirements for neighboring states and federal lands.
- Forestry industry and some commenters cited results from a Watersheds Research Cooperative (“paired watershed study”) as evidence that current FPA riparian buffers are effective at achieving water quality standards and protect designated uses.
 - Net overall temperature decrease after clear-cut harvesting along non-fish bearing streams were likely because of increased slash debris along the stream after harvest, not allowed by FPA.
 - Without slash, temperature results are consistent with RipStream findings.

Small, Non-fish bearing streams: voluntary approach

Deficiencies: No buffers for non-fish bearing streams. (Note: Non-fish bearing streams make up at least 70% of the stream miles in Oregon coastal areas.) Creates temperature, sediment, and runoff problems for salmon spawning areas and downstream habitat.

1. Voluntary Approach Needs:

- a. **Program Description:** Describe the voluntary or incentive-based program the state will use to encourage implementation of the additional management measure to provide greater protection of riparian buffers along non-fish bearing streams. Describe methods the state will use to track and evaluate those voluntary program. Examples include: Voluntary buffers and protections from 50-100 feet. 50-foot no-cut buffers. Scope should include non-fish bearing streams especially those affecting downstream water quality above confluences of nonfish bearing streams and fish-bearing streams, buffering hollows, inner gorges, headwalls, unstable landforms, and stream initiation points, and special aquatic sites like seeps, springs, wetlands and beaver ponds.
- b. **Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. Could use monitoring and tracking methods similar to other ODF programs.
- c.

Formatted: Highlight

Comment [AC2]: I think it’s important to stay true to lang. in EPM guidance.

Section below addresses monitoring, doesn’t make sense to include here.

Comment [AC3]: I think this is getting beyond what we called out in the 1998 conditional approval findings for riparian protection. This section should only address protection of riparian areas around non-fish streams which was discussed in 1998 findings. Buffers around unstable landforms is addressed in landslide area.

Ex. 5 - Attorney Client

Ex. 5 - Attorney Client

What Oregon Proposed:

- No regulatory buffer requirements for non-fish streams

INTERNAL EPA – ATTORNEY-CLIENT PRIVILEGED

- Voluntary: Voluntary measures such as large wood placement, retaining additional basal area, and treating non-fish bearing streams as fish-bearing streams.

Comment [CW5]: Taken from 1st December RA briefing. Alan, can you clarify?

Why Oregon's Efforts Are Not Sufficient:

- Scientific, state and ODF studies clearly indicate that riparian protection around non-fish bearing streams in Oregon is not sufficient to protect water quality and beneficial uses.
 - The 2011 ODF RipStream study found that FPA riparian protections on private forest lands did not ensure achievement of the Protection of Cold Water criterion (PCW) under the Oregon water quality standard for temperature.
- Oregon's buffer protections are also much less stringent than requirements for neighboring states and federal lands.
- Forestry industry and some commenters cited results from a Watersheds Research Cooperative ("paired watershed study") as evidence that current FPA riparian buffers are effective at achieving water quality standards and protect designated uses.
 - Net overall temperature decrease after clear-cut harvesting along non-fish bearing streams were likely because of increased slash debris along the stream after harvest, not allowed by FPA.
 - Without slash, temperature results are consistent with RipStream findings.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Roads in Oregon CZARA

- **General CZARA Guidelines for Approval:** Two ways for states to have an approvable program: 1) *regulatory program*; OR 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.²

Roads: Voluntary Approach

Deficiencies: Does not include legacy roads. Oregon's voluntary approach does not include monitoring and tracking.

1. Voluntary Approach Needs:

- Program Description:** Describe methods the state will use to track and evaluate those ~~voluntary program~~ Describe the voluntary or incentive-based program the state will use to encourage implementation of the additional management measures for forestry roads. Examples include:
 - Move forward with establishing road survey or inventory program that considers both active, inactive, and legacy roads.
 - The program should establish a timeline for addressing priority road issues, including retiring or restoring forest roads that impair water quality.

Comment [AC6]: I think it's important to stay true to lang. in EPM guidance.

Section below addresses monitoring, doesn't make sense to include here.

Formatted: Highlight

Comment [AC7]: We haven't used this "milestone" language in the riparian voluntary section. Should be consistent with the level of tracking/evaluation we are requiring for each voluntary approach. If we mention that establishing milestones may be helpful here, we should do the same for the others. However, would we hold OR's feet to the fire for establishing milestones? I'm not sure we would. Other states have provided milestones for voluntary programs but I don't believe all have. Would have to check.

² [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. What Oregon Proposed

- **Regulatory:** Board of Forestry has made several improvements to general road maintenance measures to improve water quality:
 - Establishment of a "Critical Locations" policy to avoid building roads in critical locations such as high hazards landslide areas, steep slopes, or within 50 feet of waterbodies;
 - Creation of additional rules to address wet-weather hauling; and
 - Revision of an existing road drainage rule to reduce sediment delivery.
- **Voluntary:** several different restoration and monitoring activities including:
 - OWEB voluntary Road Hazard and Identification and Risk Reduction Project where forestland owners survey road networks to identify roads that pose risks to salmonid habitat and prioritize roads for remediation. Oregon reports that thousands of road miles have been inspected and repaired across Oregon since the inception of this program in 1997.
 - Cooperative agreement with the USDA Forest Service to update the State's GIS data layer for forest roads. The data layer will help Oregon conduct a rapid road survey to evaluate and prioritize road risks to soil and water resources.
 - Undertaking a third-party audit in 2014 to assess compliance with the FPA rules governing forest road construction and maintenance.

Why Oregon's Efforts Are Not Sufficient

- 2005 Oregon Coastal Coho Assessment by OWEB/ODFW shows that old roads make up majority of forest roads, and road inventory on private land is not widely available.
- **New Regulatory Drainage Requirements:** The rule changes and new policies do not sufficiently address water quality problems associated with "legacy roads" (e.g., roads that do not meet current state requirements with respect to siting, construction, maintenance, and road drainage). Requirements are triggered only when new road construction or re-construction of existing roads occurs.
- **Voluntary Road Hazard/Identification Program:** Oregon did not indicate the program's impact within the coastal nonpoint program management area or how many of these projects addressed active forest roads and roads retired according to current FPA practices versus problems associated with older, legacy roads.
- **Agreement with USDA to Update GIS Data Layers:** In Oregon's submittal. Oregon noted it hoped to begin survey in 2014; therefore this survey cannot count towards coastal NPS program until

INTERNAL EPA – ATTORNEY-CLIENT PRIVILEGED

completed. Also, federal agencies are not aware if the survey and GIS layer will consider legacy roads or how Oregon will use the data to direct future management actions.

- Third-Party Audit: Issues resulting from legacy roads and general road maintenance issues where construction or reconstruction is not occurring would not be captured during compliance audit of FPA rules since these issues are outside the scope of rules.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Landslide-Prone Areas in Oregon CZARA

- **General CZARA Guidelines for Approval:** Two ways for states to have an approvable program: 1) *regulatory program*; OR 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.³

Landslide-Prone Areas: Voluntary Approach

Deficiencies: Does not protect for water resources.

1. Voluntary Approach Needs:

- Program Description:** Describe voluntary, or incentive-based program(s) Oregon will use to encourage implementation of the additional management measures to protect high-risk landslide areas that have the potential to impact water quality and designated uses. Describe methods the state will use to track and evaluate those voluntary program. Examples include:

- Develop scientifically rigorous process for identifying high-risk areas and unstable slopes based on field review by trained staff. Slope, landform, sediment and wood delivery potential and geologic factors should be used in the designation. LiDAR and DEMs are useful tools to identify and designate areas.
- Adopt harvest and road construction restrictions similar to those where landslides pose risks to life and property, for all high-risk landslide prone areas with moderate to high potential to impact water quality and designated uses.
- Develop and promote more robust voluntary practices to encourage and incentivize forestry best management practices to protect high-risk landslide areas that have the potential to impact water quality and designated uses, such as no-harvest restrictions around high-risk areas and building roads that minimize slope failures.

Formatted: Highlight

Formatted: Highlight

Comment [AC12]: This reads like a regulatory action? Are we just asking them to promote voluntary practices similar to regulatory requirements?

Formatted: Highlight

³ [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing "BMP shields" and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

- b. **Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. Examples include:
- i. Institute a monitoring program to track compliance with the FPA rules and voluntary guidance for high-risk landslide prone areas and the effectiveness of these practices in reducing slope failures.
 - ii. Establish a monitoring program that assesses the underlying causes and water quality impacts of landslides shortly after they occur and generates specific recommendations for future management. In particular, look for ways to reduce channelized landslides.
- c. **Enforceable Mechanism:** ~~Explore existing state enforcement authorities that can be used to prevent nonpoint pollution and require implementation of this measure, as necessary.~~ Include a description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

Comment [AC13]: See other comment on revised lang. for this section.

What Oregon Proposed

- **Regulatory:** Amended FPA rules to require the identification of landslide hazard areas in timber harvesting plans and road construction and to place certain restrictions on harvest and road activities within these designated high-risk landslide areas for *public safety*.
- **Voluntary:** Promotes voluntary practices through Oregon Plan; gives landowners credit for leaving standing live trees along landslide-prone areas as a source of large wood.

Why Oregon's Efforts Are Not Sufficient:

- A number of studies continue to show significant increases in landslide rates after clear cutting compared to unmanaged forests in the Pacific Northwest. Research also shows that landslides degrade water quality and impair designated uses in Pacific Northwest streams.
- **Regulatory Approach:** Landslide hazards are addressed only as they relate to risks for losses of life and property, *not for potential water quality impacts*. Oregon still allows timber harvest and the construction of forest roads, where alternatives are not available, on high-risk landslide hazard areas as long as it is not deemed a public safety risk.
- **Voluntary Approach:** Practices are not designed to protect high-risk erosion areas but rather to ensure large wood is available to provide additional stream complexity when landslides occur.

Disclaimer: The following are examples of reasonable options for Oregon to have an approvable program. The State may choose other options, but they must meet the elements of the CZARA guidelines. These options have not been fully vetted by the technical team.

Spray Buffers for Aerial Application of Herbicides on Non-fish Bearing Streams in Oregon CZARA

- **General CZARA Guidelines for Approval:** Two ways for states to have an approvable program: 1) *regulatory program*; OR 2) *voluntary or incentive-based program*, backed by existing state enforcement authorities and includes methods for tracking and evaluating the program.⁴

Spray Buffers for Aerial Application of Herbicides on Non-fish Bearing Streams: Voluntary Approach

Deficiencies: No spray buffer. Non-fish bearing streams make up at least 70% of Oregon coast stream network. Aerial drift and primary and secondary impacts to aquatic and terrestrial life.

1. **Adequate riparian protections for non-fish bearing streams may also be sufficient for herbicide spray buffers; OR**
2. **Voluntary Approach Needs:**
 - a. **Program Description:-** Describe voluntary, or incentive-based program(s) Oregon will use to encourage implementation of the additional management measures to protect non-fish bearing streams during the aerial application of herbicides. Describe methods the state will use to track and evaluate those voluntary program. Examples include:
 - i. Develop guidelines for voluntary buffer protections for aerial application of herbicides on non-fish bearing streams
 - ii. Educate and train aerial applicators of herbicides on the new guidance and how to minimize aerial drift to waterways, including non-fish bearing streams and surrounding communities;
 - iii. Provide better maps of non-fish bearing streams and other sensitive sites and structures to increase awareness of these sensitive areas that need protection among the aerial applicator community; and
 - iv. Employ GPS technology, linked to maps of non-fish bearing streams to automatically shut off nozzles before crossing non-fish bearing streams.

⁴ [EPA and NOAA policies] provide states flexibility by granting full approval for those program elements for which states have proposed voluntary or incentive-based programs, backed by existing state enforcement authorities, if the following is provided:

- A legal opinion from the attorney general or an attorney representing the agency with jurisdiction for enforcement that such authorities can be used to prevent nonpoint pollution and require management measure implementation, as necessary;
- A description of the voluntary or incentive-based programs, including the methods for tracking and evaluating those programs, the State will use to encourage implementation of the management measures; and
- A description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

From Enforceable Policies and Mechanisms for State Coastal Nonpoint Source Programs memo, Jan 23, 2001.

In the specific case of Oregon, in order to use voluntary or incentive-based programs to achieve additional management measures for forestry, Oregon would have to meet each of the three prongs above for each of the outstanding management measures. The required legal opinion must also address whether or not there are any existing "BMP shields" and provide assurances that the existing general enforcement authorities would not be subject to BMP shields.

Comment [AC14]: What do we mean by this? What do we consider "adequate"? I think the state will want to know.

Ex. 5 - Deliberative

Comment [AC15]: "May"? can we give a definitive yes/no.

Formatted: Highlight

Comment [AC16]: That say what? Should provide examples of what sorts of BMPs we're looking for in these guidelines. It's my understanding that the state already has guidelines that cover a lot of BMPs. What else are we looking for?

- v. Revise ODF Notification of Operation form to add a check box for aerial applicators to adhere to FIFRA labels for all stream types.
- b. **Monitoring and Tracking:** Describe methods the state will use to track and evaluate those voluntary programs. For example, track the implementation of voluntary measures for the aerial application of herbicides along non-fish bearing streams and assess the effectiveness of these practices to protect water quality and designated uses.
- c. **Enforceable Mechanism** – Explore existing state enforcement authorities that can be used to prevent nonpoint pollution and require implementation of this measure, as necessary. Include a description of the mechanism or process that links the implementing agency with the enforcement agency and a commitment to use the existing enforcement authorities where necessary.

Comment [AC17]: See other comments on this section.

What Oregon Proposed:

- Regulatory:
 - Follows FIFRA label requirements.
 - ODF requires all pesticide applicators to complete a notification form of potential pesticides that may be applied.
 - ODF/ODA require pesticide applicators undergo training and obtain licenses. Training includes a review of regulations and requirements for protecting streams during aerial application. To reduce aerial drift, Oregon has guidance that instructs applicators to consider temperature, relative humidity, wind speed, and wind direction.
- Voluntary:
 - Water Quality Pesticide Management Plan (WQPMP): Interagency guide providing state-wide and watershed-level actions to protect surface and groundwater from potential impacts of pesticides, including herbicides. The plan, approved by EPA Region 10, describes management responses from voluntary to regulatory actions Oregon could take to address pesticide issues. The plan focuses on water quality monitoring data as the driver for adaptive management actions.
 - Pesticide Stewardship Partnership (PSP): Pilot pesticide water quality monitoring effort. ODEQ works with State and local partners to collect and analyze water samples and use the data to focus technical assistance and best management practices on streams and pesticides that pose a potential aquatic life or human health impact.

Why Oregon's Efforts Are Not Sufficient

- Oregon does not require riparian buffers during forest harvests along non-fish bearing streams, which might otherwise provide a spray buffer to filter herbicide-laden runoff before it enters the streams.
- NMFS BiOp for several EPA herbicide labels identifies aerial drift as the most likely pathway for herbicides to enter aquatic habitats affecting primary and secondary production. NMFS concluded that products containing 2,4-D are likely to jeopardize the existence of all listed salmonids and adversely modify or destroy critical habitat. Products containing diuron were also likely to adversely modify or destroy critical habitat.
- ODF's Notification Form: The form does not include guidance for spraying over non-fish bearing streams. Also allows for applicator to list many possible pesticides so it is difficult to determine which pesticide is actually applied.
- WQPMP and PSP: Water quality monitoring data on pesticides are still limited in Oregon. Oregon has only established eight pilot PSP monitoring areas in seven watersheds, none of which are within

INTERNAL EPA – ATTORNEY-CLIENT PRIVILEGED

the coastal nonpoint management area. Difficult to operate an adaptive management-driven program if you lack data to know when adjustments are needed.

- FIFRA: EPA, NMFS, USFWS and USDA are working to improve the national risk assessment process for pesticide labels but don't expect to update herbicide labels for ~ 15 yrs.
- Oregon and other Pacific Northwest states have already recognized the need to go beyond the national FIFRA label requirements. Neighboring states have stricter buffer requirements for herbicides application along non-fish bearing streams.

INTERNAL EPA – ATTORNEY-CLIENT PRIVILEGED

Implementation-Ready TMDLs and Oregon CZARA

Note that the State had originally agreed to complete an implementation-Ready TMDL for the Midcoast Basin as described in state memos to the original Settlement Agreement in order to meet CZARA requirements for 3 of 4 forestry measures. The original memo describing the state's commitments is available upon request.

Comment [CJ18]: Include memo or use this statement?
